IMIDAZO (4,3-E)-1,2,4-TRIAZOLO (1,5-C) PYRIMIDINES AS ADENOSINE A<sub>2A</sub> RECEPTOR ANTAGONISTS

10

BACKGROUND

15

The present invention relates to substituted 5-amino-imidazo-[4,3-e]-1,2,4-triazolo[1,5-c]pyrimidine adenosine A<sub>2a</sub> receptor antagonists, the use of said compounds in the treatment of central nervous system diseases, in particular Parkinson's disease, and to pharmaceutical compositions comprising said compounds.

20

Adenosine is known to be an endogenous modulator of a number of physiological functions. At the cardiovascular system level, adenosine is a strong vasodilator and a cardiac depressor. On the central nervous system, adenosine induces sedative, anxiolytic and antiepileptic effects. On the respiratory system, adenosine induces bronchoconstriction. At the kidney level, it exerts a biphasic action, inducing vasoconstriction at low concentrations and vasodilation at high doses. Adenosine acts as a lipolysis inhibitor on fat cells and as an antiaggregant on platelets.

25

Adenosine action is mediated by the interaction with different membrane specific receptors which belong to the family of receptors coupled with G proteins. Biochemical and pharmacological studies, together with advances in molecular biology, have allowed the identification of at least four subtypes of adenosine receptors: A<sub>1</sub>, A<sub>2a</sub>, A<sub>2b</sub> and A<sub>3</sub>. A<sub>1</sub> and A<sub>3</sub> are high-affinity, inhibiting the activity of the enzyme adenylate cyclase, and A<sub>2a</sub> and A<sub>2b</sub> are low-affinity, stimulating the activity of the same enzyme. Analogs of adenosine able to interact as antagonists with the A<sub>1</sub>, A<sub>2a</sub>, A<sub>2b</sub> and A<sub>3</sub> receptors have also been identified.

30

Selective antagonists for the A<sub>2a</sub> receptor are of pharmacological interest because of their reduced level of side affects. In the central nervous system, A<sub>2a</sub> antagonists can have antidepressant properties and stimulate cognitive functions. Moreover, data has shown that A<sub>2a</sub> receptors are present in high density in the basal

35

- 2 -

ganglia, known to be important in the control of movement. Hence,  $A_{2a}$  antagonists can improve motor impairment due to neurodegenerative diseases such as Parkinson's disease, senile dementia as in Alzheimer's disease, and psychoses of organic origin.

5 Some xanthine-related compounds have been found to be  $A_1$  receptor selective antagonists, and xanthine and non-xanthine compounds have been found to have high  $A_{2a}$  affinity with varying degrees of  $A_{2a}$  vs.  $A_1$  selectivity. Triazolo-pyrimidine adenosine  $A_{2a}$  receptor antagonists with different substitution at the 7-position have been disclosed previously, for example in WO 95/01356; US 5,565,460; WO  
 10 97/05138; WO 98/52568 and US Provisional Application 60/334,342. Pyrazolo-substituted triazolo-pyrimidine adenosine  $A_{2a}$  receptor antagonists are disclosed in WO 01/92264.

### SUMMARY OF THE INVENTION

15 The present invention relates to a compound represented by the structural formula I

or a pharmaceutically acceptable salt thereof, wherein

R is  $R^1$ -heteroaryl,  $R^{10}$ -phenyl,  $C_4$ - $C_6$  cycloalkenyl,  $-C(=CH_2)CH_3$ ,  $-C\equiv C-CH_3$ ,

20  $-C\equiv C-CH_2-OR^2$ ,  $-CH=C(CH_3)_2$ ,  or  ;

X is  $C_1$ - $C_6$  alkylene,  $-C(O)CH_2-$  or  $-C(O)N(R^2)CH_2-$ ;

Y is  $-N(R^2)CH_2CH_2N(R^3)-$ ,  $-OCH_2CH_2N(R^2)-$ ,  $-O-$ ,  $-S-$ ,  $-CH_2S-$ ,  $-(CH_2)_{2-3}-N(R^2)-$ ,

$R^5$ -divalent heteroaryl,

R<sup>15</sup> is H, halogen, C<sub>1</sub>-C<sub>6</sub> alkyl or C<sub>1</sub>-C<sub>6</sub> alkoxy.

10 Another aspect of the invention is a pharmaceutical composition comprising a therapeutically effective amount of a compound of formula I in a pharmaceutically acceptable carrier.

Yet another aspect of the invention is a method of treating central nervous system diseases such as depression, cognitive diseases and neurodegenerative diseases such as Parkinson's disease, senile dementia or psychoses of organic  
15 origin, or stroke, comprising administering a compound of formula I to a mammal in need of such treatment. In particular, the invention is drawn to the method of treating Parkinson's disease comprising administering a compound of formula I to a mammal in need of such treatment.

Still another aspect of the invention is a method of treating Parkinson's disease  
20 with a combination of a compound of formula I and one or more agents useful in the treatment of Parkinson's disease, for example dopamine; a dopaminergic agonist; an inhibitor of monoamine oxidase, type B (MAO-B); a DOPA decarboxylase inhibitor (DCI); or a catechol-O-methyltransferase (COMT) inhibitor. Also claimed is a pharmaceutical composition comprising a compound of formula I and one or more  
25 agents known to be useful in the treatment of Parkinson's in a pharmaceutically acceptable carrier.

#### DETAILED DESCRIPTION

Referring to compounds of formula I above, preferred compounds of formula I  
30 are those wherein R is R<sup>1</sup>-furanyl, R<sup>1</sup>-thienyl, R<sup>1</sup>-pyrrolyl, R<sup>1</sup>-pyridyl or R<sup>10</sup>-phenyl, more preferably R<sup>1</sup>-furanyl or R<sup>10</sup>-phenyl. R<sup>1</sup> is preferably hydrogen or halogen. R<sup>10</sup> is preferably hydrogen, halogen, alkyl or -CF<sub>3</sub>. Another group of preferred compounds

- 6 -

is that wherein X is alkylene, preferably ethylene. Y is preferably

wherein Q is  $\text{—}\overset{\text{I}}{\text{N}}\text{—}$  or  $\text{—}\overset{\text{I}}{\text{CH}}\text{—}$ , with Q preferably being nitrogen. Preferably, m and n are each 2, and R<sup>4</sup> is H. A preferred definition for Z is R<sup>5</sup>-phenyl or R<sup>5</sup>-heteroaryl. R<sup>5</sup> is preferably H, halogen, alkyl, alkoxy, hydroxyalkoxy or alkoxyalkoxy. R<sup>6</sup> is preferably R<sup>5</sup>-phenyl. R<sup>14</sup> is preferably hydrogen.

When Y and Z together form a piperidinyl or pyrrolidinyl ring fused to a monocyclic or bicyclic aryl or heteroaryl ring, preferred fused ring structures are

wherein A<sup>1</sup> is  $\text{—}\overset{\text{I}}{\text{N}}\text{—}$  and A<sup>2</sup> and A<sup>3</sup> each are  $\text{—C(R}^{16}\text{)(R}^{17}\text{)—}$ , or

A<sup>1</sup> and A<sup>3</sup> each are  $\text{—C(R}^{16}\text{)(R}^{17}\text{)—}$  and A<sup>2</sup> is  $\text{—}\overset{\text{I}}{\text{N}}\text{—}$ , or

A<sup>1</sup> and A<sup>2</sup> each are  $\text{—C(R}^{16}\text{)(R}^{17}\text{)—}$ , and A<sup>3</sup> is  $\text{—}\overset{\text{I}}{\text{N}}\text{—}$ ;

A<sup>4</sup> is  $\text{—C(R}^{16}\text{)(R}^{17}\text{)—}$ ;

J<sup>1</sup>, J<sup>2</sup>, J<sup>3</sup> and J<sup>4</sup> are selected from the group consisting of  $\text{—N=}$  and  $\text{—C(R}^{18}\text{)—}$ , provided that 0-2 of J<sup>1</sup>, J<sup>2</sup>, J<sup>3</sup> or J<sup>4</sup> are  $\text{—N=}$  and the remainder are  $\text{—C(R}^{18}\text{)—}$ ;

J<sup>5</sup> is  $\text{—N(R}^{17}\text{)—}$ ,  $\text{—O—}$ ,  $\text{—S—}$  or  $\text{—C(R}^{16}\text{)(R}^{17}\text{)—}$ ;

J<sup>6</sup> is  $\text{—N=}$  or  $\text{—C(R}^{18}\text{)—}$ ;

J<sup>7</sup> is  $\text{—N=}$  or  $\text{—C(R}^{18}\text{)—}$ ;

t is 0 or 1;

each R<sup>16</sup> is independently selected from the group consisting of hydrogen, C<sub>1</sub>-

C<sub>6</sub>-alkyl, C<sub>1</sub>-C<sub>6</sub>-alkoxy,  $\text{—CF}_3$ , halogen,  $\text{—OH}$  and  $\text{NO}_2$ ;

each R<sup>17</sup> is independently selected from the group consisting of hydrogen and C<sub>1</sub>-C<sub>6</sub> alkyl; and

each R<sup>18</sup> is independently selected from the group consisting of hydrogen, C<sub>1</sub>-C<sub>6</sub>-alkyl,  $\text{CF}_3$ , halogen,  $\text{NO}_2$ , C<sub>1</sub>-C<sub>6</sub>-alkoxy,  $\text{—O—C(O)—(C}_1\text{—C}_6\text{—alkyl)}$ ,  $\text{—NH}_2$ ,  $\text{—NH(C}_1\text{—C}_6\text{—alkyl)}$

alkyl),  $-N(C_1-C_6\text{-alkyl})_2$ ,  $-NH-C(O)-(C_1-C_6\text{-alkyl})$ ,  $-NH-SO_2-(C_1-C_6\text{-alkyl})$ ,  $-SO_2NH(C_1-C_6\text{-alkyl})$ ,  $-SO_2N(C_1-C_6\text{-alkyl})_2$ ,  $-SO_2NH_2$  and  $-OH$ .

In the above structures, when  $A^1$ ,  $A^2$  or  $A^3$  is  $\begin{array}{c} | \\ -N- \end{array}$ , two of the bonds are part of the ring and the third bond joins the ring to the variable X.

- 5 In the definition of Q and  $Q^1$ , "at least one of Q and  $Q^1$  is  $\begin{array}{c} | \\ -N- \end{array}$  or  $\begin{array}{c} | \\ -CH- \end{array}$ " means that one of Q and  $Q^1$  can be nitrogen and the other is selected from the remaining groups, both are nitrogen, both are CH, or one is CH and the other is selected from the remaining groups.

As used herein, the term alkyl includes straight or branched chains. Alkylene, referring to a divalent alkyl group, similarly refers to straight or branched chains. Cycloalkylene refers to a divalent cycloalkyl group. Cycloalkenyl refers to a  $C_4-C_6$  cycloalkyl ring comprising one double bond.

Aryl means phenyl or naphthyl.

- Heteroaryl means a single ring heteroaromatic group of 5 to 6 atoms comprised of 2 to 5 carbon atoms and 1 to 3 heteroatoms independently selected from the group consisting of N, O and S, provided that the rings do not include adjacent oxygen and/or sulfur atoms. Examples of single-ring heteroaryl groups are pyridyl, oxazolyl, isoxazolyl, oxadiazolyl, furanyl, pyrrolyl, thienyl, imidazolyl, pyrazolyl, thiazolyl, isothiazolyl, thiadiazolyl, pyrazinyl, pyrimidyl, pyridazinyl and triazolyl.
- 20 Bicyclic heteroaryl means a bicyclic heteroaromatic group of 5 to 10 atoms comprised of 1 to 9 carbon atoms and 1 to 3 heteroatoms independently selected from the group consisting of N, O and S, provided that the rings do not include adjacent oxygen and/or sulfur atoms. Examples of bicyclic heteroaryl groups are naphthyridyl (e.g., 1, 5 or 1,7), imidazopyridyl, pyrido[2,3]imidazolyl, pyridopyrimidinyl and 7-azaindolyl.
- 25 Benzofused heteroaryl bicyclic groups comprise a heteroaryl ring as defined above fused at adjacent carbon atoms to a phenyl ring. Examples of benzofused heteroaryl groups are indolyl, quinolyl, isoquinolyl, phthalazinyl, benzothienyl (i.e., thionaphthenyl), benzimidazolyl, benzofuranyl, benzoxazolyl and benzofurazanyl. All positional isomers are contemplated, e.g., 2-pyridyl, 3-pyridyl and 4-pyridyl. N-oxides of the ring nitrogens for all heteroaryl groups are also included.  $R^5$ -substituted
- 30

heteroaryl refers to such groups wherein substitutable ring carbon atoms have a substituent as defined above.

Divalent heteroaryl means a heteroaryl ring bonded to two different groups. In the context of this invention, when Y is divalent R<sup>5</sup>-heteroaryl, one ring member is attached to the variable X, and another ring member is attached to variable Z; the R<sup>5</sup> substituents are attached to the remaining ring members. Divalent heteroaryl groups are named by adding "diyl" to the name of the ring, for example, a pyridinediyl ring is shown:

Certain compounds of the invention may exist in different stereoisomeric forms (e.g., enantiomers, diastereoisomers and atropisomers). The invention contemplates all such stereoisomers both in pure form and in mixture, including racemic mixtures.

Certain compounds will be acidic in nature, e.g. those compounds which possess a carboxyl or phenolic hydroxyl group. These compounds may form pharmaceutically acceptable salts. Examples of such salts may include sodium, potassium, calcium, aluminum, gold and silver salts. Also contemplated are salts formed with pharmaceutically acceptable amines such as ammonia, alkyl amines, hydroxyalkylamines, N-methylglucamine and the like.

Certain basic compounds also form pharmaceutically acceptable salts, e.g., acid addition salts. For example, pyrido-nitrogen atoms may form salts with strong acid, while compounds having basic substituents such as amino groups also form salts with weaker acids. Examples of suitable acids for salt formation are hydrochloric, sulfuric, phosphoric, acetic, citric, oxalic, malonic, salicylic, malic, fumaric, succinic, ascorbic, maleic, methanesulfonic and other mineral and carboxylic acids well known to those skilled in the art. The salts are prepared by contacting the free base form with a sufficient amount of the desired acid to produce a salt in the conventional manner. The free base forms may be regenerated by treating the salt with a suitable dilute aqueous base solution such as dilute aqueous NaOH, potassium carbonate, ammonia and sodium bicarbonate. The free base forms differ from their respective salt forms somewhat in certain physical properties, such as

solubility in polar solvents, but the acid and base salts are otherwise equivalent to their respective free base forms for purposes of the invention.

All such acid and base salts are intended to be pharmaceutically acceptable salts within the scope of the invention and all acid and base salts are considered equivalent to the free forms of the corresponding compounds for purposes of the invention.

Compounds of formula I are prepared by methods known in the art. Preferably, the compounds of formula I are prepared by the methods shown in the following reaction schemes.

In the reaction schemes and the examples that follow, the following abbreviations are used: Ts (tosyl); Bn (benzyl); Me (methyl); Et (ethyl); and Ac (acetyl).

In Scheme 1, alkylation of a 5-amino-imidazolo[4,3-e]-[1,2,4]-triazolo-[1,5-c]pyrimidine of formula II is used to prepare compounds of formula I:

Scheme 1:

Starting materials of formula II can be reacted with an alkyl diol ditosylate and a base such as NaH in an inert solvent such as dimethylformamide (DMF), or with a chloro-bromo- or dibromo-alkyl compound under similar conditions, to obtain the 7- and 9-alkyl-substituted intermediates of formula IIIa and III b. The compound of formula IIIa is then reacted with an amine of the formula Z-Y-H in an inert solvent such as DMF at an elevated temperature to obtain a compound of formula Ia, i.e., a compound of formula I wherein X is alkylene.

- 10 -

Alternatively, starting materials of formula II can be reacted with a compound of formula Z-Y-X-Cl and a base such as NaH in an inert solvent such as DMF to obtain a mixture of a 7-substituted compound of formula I and the corresponding 9-substituted compound.

- 5        Compounds of formula II can be prepared using the general procedure described in Scheme 2.

Scheme 2:

- 10        Commercially available 2-amino-6-bromo purine or 2-amino-6-chloro purine can be reacted with the corresponding hydrazide in butanol at elevated temperatures to produce the displacement product, which can be treated with N,O-bis(trimethylsilyl) acetamide to produce II.

- 15        To prepare compounds of formula I wherein Y is piperazinyl and Z is  $R^6\text{-C(O)-}$ ,  $R^6\text{-SO}_2\text{-}$ ,  $R^6\text{-OC(O)-}$ ,  $R^7\text{-N(R}^8\text{)-C(O)-}$  or  $R^7\text{-N(R}^8\text{)-C(S)-}$ , a compound of formula I wherein Z-Y is 4-t-butoxycarbonyl-1-piperazinyl is deprotected, for example by reaction with an acid such as HCl. The resultant free piperazinyl compound, IV, is treated according to procedures well known in the art to obtain the desired compounds. The following Scheme 3 summarizes such procedures:

Another method for preparing compounds of formula I is shown in Scheme 4:

### Scheme 4:

In this procedure, chloroimidazo-pyrimidine V, wherein R<sup>20</sup> is as defined above, is reacted with a compound of formula Z-Y-X-Cl in a manner similar to the alkylation procedure of Scheme 1, and the resultant intermediate is reacted with a hydrazide of formula H<sub>2</sub>N-NH-C(O)-R (or with hydrazine hydrate, followed by a compound of formula Cl-C(O)-R). The resultant hydrazide undergoes dehydrative rearrangement,

e.g., by treatment with N,O-bis-(trimethylsilyl)acetamide (BSA) or a combination of BSA and hexamethyldisilazane (HMDS) and at elevated temperatures.

Starting materials are known or are prepared by processes known in the art.

Another method for preparing compounds of formula I is illustrated in the

5 following Scheme 5:

Scheme 5:

In analogy to Scheme 1, chloride V is converted into alkylated compound XII, and this is further reacted with XIV, where  $\text{R}'$  is preferably *t*-butyl or benzyl, to obtain  
 10 derivative XIII. A solvent such as DMF may be employed at a temperature of 60-120°C. This is then reacted as in Scheme 1 to furnish XV. The- $\text{R}'$  group is next removed, such as removal of a *t*-butyl group with HCl or trifluoroacetic acid (TFA), furnishing hydrazine XVI. Acylation of XVI furnishes XVII, which is subjected to dehydrative cyclization as described above to provide desired Ia. Alternatively, XII  
 15 may be reacted with a hydrazide XVIII to obtain XIX, which can be converted to XVII analogously to preparation of XV.

- 13 -

To prepare compounds of formula IIa, wherein  $R^{14}$  is other than hydrogen, the following procedure can be used:

Scheme 6:

- 5 The amide of formula XIX is prepared by reacting the pyrimidine of formula XVIII and the acid chloride or anhydride in the presence of a base such as NaOH, and the compound of formula XIX is then cyclized using a reagent such as  $\text{POCl}_3$  to obtain the chloroimidazolo-pyrimidine of formula Va. The compound of formula Va is reacted with the hydrazide as described in Scheme 2 to obtain the intermediate IIa,
- 10 which can then be used to prepare a compound of formula I as described in Scheme 1. Compound XVIII, the acid chlorides and the hydrazines are known or can be prepared by processes known in the art.

- Schemes 7 to 10 show procedures for preparing starting materials for compounds wherein Y and Z together form an aryl- or heteroaryl- fused piperidiny or pyrrolidinyl group. The resultant Y-Z portions can be reacted with a compound of
- 15 formula IIIa as described in Scheme 1 to obtain the desired compounds of formula I. The aromatic portions of the fused ring groups are substituted by independently selected  $R^{18}$  groups, designated in the schemes as  $R^{18'}$ ,  $R^{18''}$  and  $R^{18'''}.$

Benzyl piperidinone is cyclized with an aminoacrylaldehyde of formula XX to form the benzyl protected tetrahydronaphthylidene of formula XXI, followed by hydrogenolysis to obtain the compound of formula XXII.

Scheme 8:

Quaternization of a naphthyridine of formula XXIII followed by reduction gives a benzyl protected tetrahydronaphthylidene of formula XXIIa. Hydrogenolysis provides the desired product of formula XXIIa.

Scheme 9:

[2+2+2] cyclization of a diene of formula XXIV with an acetylene of formula XXV provides the benzyl protected isoindoline of formula XXVI. Hydrogenolysis provides the desired compound of formula XXVII.

Scheme 10:

Pictet-Spengler cyclization of a phenethylamine of formula XXVIII gives a substituted tetrahydroisoquinoline of formula XXIX.

Using the above procedures, the following compounds were prepared.

Preparation 1

- 15 -

Step 1: Heat a mixture of 2-amino-6-bromo purine (1.0 g, 4.7 mmol) and 2-furoic hydrazide (0.88 g, 7.0 mmol) in butanol (10 ml) at 120°C overnight. Collect the solid by filtration, wash with CH<sub>3</sub>OH and dry the solid in vacuum oven to produce a white solid. MS (ESI): M+1 = 260.1. PMR (DMSO)  $\delta$  6.71 (d, J = 1.6 Hz, 1H), 7.32 (s, 1H), 7.41 (bs, 2H), 7.96 (s, 1H), 8.19 (s, 1H), 10.40 (bs, 1H), 10.86 (s, 1H).

Step 2: Heat the product of Step 1 (1.3 g, 5 mmol) in N, O-bis (trimethylsilyl) acetamide (6.10 g, 30 mmol) at 100°C overnight. Cool the reaction mixture and pour it on ice water and stir for 4h. Collect the solid by filtration and wash with CH<sub>3</sub>OH, Et<sub>2</sub>O and dry to produce a white solid.

MS (ESI): M+1 = 242. PMR (DMSO)  $\delta$  6.71 (dd, J = 1.7 & 3.4 Hz, 1H), 7.21 (d, J = 2.9 Hz, 1H), 7.67 (s, 1H), 7.92 (s, 1H), 7.99 (s, 1H).

Step 3: Combine the product of Step 2 (5.0 g, 20.7 mmol) and ethylene glycol ditosylate (8.45 g, 22.8 mmol) in dry DMF (30 ml). Cool the reaction mixture to 0°C under N<sub>2</sub>. Add NaH (60% in oil, 0.91 g, 22.8 mmol) in portions, keeping internal temperature at 0°C. Warm the reaction mixture to room temperature and stir overnight. Pour the reaction mixture on ice/water and stir for 4h. Collect the solid by filtration and chromatograph it on silica gel to produce the title compound.

MS (ESI): M+1 = 440.10, PMR (DMSO)  $\delta$  1.98 (s, 3H), 4.38 (d, J = 4.3 Hz, 2H), 4.47 (t, J = 4.4 Hz, 2H), 6.72 (dd, J = 1.7 & 3.4 Hz, 1H), 6.96 (d, J = 8.1 Hz, 2H), 7.25 (m, 1H), 7.32 (d, J = 8.2 Hz, 2H), 7.73 (s, 2H), 7.93 (s, 1H), 7.94 (d, J = 0.8 Hz, 2H).

In a similar manner to Preparation 1, but employing the corresponding hydrazide, the following compounds were prepared:

Because of their adenosine A<sub>2a</sub> receptor antagonist activity, compounds of the present invention are useful in the treatment of depression, cognitive function diseases and neurodegenerative diseases such as Parkinson's disease, senile dementia as in Alzheimer's disease, and psychoses of organic origin. In particular, the compounds of the present invention can improve motor-impairment due to neurodegenerative diseases such as Parkinson's disease.

The other agents known to be useful in the treatment of Parkinson's disease that can be administered in combination with the compounds of formula I include: L-DOPA; dopaminergic agonists such as quinpirole, ropinirole, pramipexole, pergolide and bromocriptine; MAO-B inhibitors such as deprenyl and selegiline; DOPA decarboxylase inhibitors such as carbidopa and benserazide; and COMT inhibitors such as tolcapone and entacapone. One to three other agents can be used in combination with the compounds of formula I, preferably one.

The pharmacological activity of the compounds of the invention was determined by the following *in vitro* and *in vivo* assays to measure A<sub>2a</sub> receptor activity.

Human Adenosine A<sub>2a</sub> and A<sub>1</sub> Receptor Competition Binding Assay Protocol

Membrane sources:

A<sub>2a</sub>: Human A<sub>2a</sub> Adenosine Receptor membranes, Catalog #RB-HA2a, Receptor Biology, Inc., Beltsville, MD. Dilute to 17 µg/100 µl in membrane dilution buffer (see below).

Assay Buffers:

Membrane dilution buffer: Dulbecco's Phosphate Buffered Saline (Gibco/BRL) + 10 mM MgCl<sub>2</sub>.

Compound Dilution Buffer: Dulbecco's Phosphate Buffered Saline (Gibco/BRL) + 10 mM MgCl<sub>2</sub> supplemented with 1.6 mg/ml methyl cellulose and 16% DMSO.

Prepared fresh daily.

Ligands:

A<sub>2a</sub>: [3H]-SCH 58261, custom synthesis, AmershamPharmacia Biotech, Piscataway, NJ. Stock is prepared at 1 nM in membrane dilution buffer. Final assay concentration is 0.5 nM.

- 24 -

A<sub>1</sub>: [3H]- DPCPX, AmershamPharmacia Biotech, Piscataway, NJ. Stock is prepared at 2 nM in membrane dilution buffer. Final assay concentration is 1 nM.

Non-specific Binding:

5 A<sub>2a</sub>: To determine non-specific binding, add 100 nM CGS 15923 (RBI, Natick, MA). Working stock is prepared at 400 nM in compound dilution buffer.

A<sub>1</sub>: To determine non-specific binding, add 100 µM NECA (RBI, Natick, MA). Working stock is prepared at 400 µM in compound dilution buffer.

Compound Dilution:

10 Prepare 1 mM stock solutions of compounds in 100% DMSO. Dilute in compound dilution buffer. Test at 10 concentrations ranging from 3 µM to 30 pM. Prepare working solutions at 4X final concentration in compound dilution buffer.

Assay procedure:

Perform assays in deep well 96 well plates. Total assay volume is 200 µl. Add 50 µl compound dilution buffer (total ligand binding) or 50 µl CGS 15923 working  
15 solution (A<sub>2a</sub> non-specific binding) or 50 µl NECA working solution (A<sub>1</sub> non-specific binding) or 50 µl of drug working solution. Add 50 µl ligand stock ([3H]-SCH 58261 for A<sub>2a</sub>, [3H]- DPCPX for A<sub>1</sub>). Add 100 µl of diluted membranes containing the appropriate receptor. Mix. Incubate at room temperature for 90 minutes. Harvest using a Brandel cell harvester onto Packard GF/B filter plates. Add 45 µl Microscint  
20 20 (Packard), and count using the Packard TopCount Microscintillation Counter. Determine IC<sub>50</sub> values by fitting the displacement curves using an iterative curve fitting program (Excel). Determine K<sub>i</sub> values using the Cheng-Prusoff equation.

#### Haloperidol-induced catalepsy in the rat

25 Male Sprague-Dawley rats (Charles River, Calco, Italy) weighing 175-200 g are used. The cataleptic state is induced by the subcutaneous administration of the dopamine receptor antagonist haloperidol (1 mg/kg, sc), 90 min before testing the animals on the vertical grid test. For this test, the rats are placed on the wire mesh cover of a 25x43 plexiglass cage placed at an angle of about 70 degrees with the bench table. The rat is placed on the grid with all four legs abducted and extended  
30 ("frog posture"). The use of such an unnatural posture is essential for the specificity of this test for catalepsy. The time span from placement of the paws until the first complete removal of one paw (*decent latency*) is measured maximally for 120 sec.

The selective A<sub>2A</sub> adenosine antagonists under evaluation are administered orally at doses ranging between 0.3 and 3 mg/kg, 1 and 4 h before scoring the animals.

In separate experiments, the anticataleptic effects of the reference compound,  
5 L-DOPA (25, 50 and 100 mg/kg, ip), were determined.

#### 6-OHDA Lesion of the Middle Forebrain Bundle in Rats

Adult male Sprague-Dowley rats (Charles River, Calco, Como, Italy), weighing 275-300 g, are used in all experiments. The rats are housed in groups of 4 per cage,  
10 with free access to food and water, under controlled temperature and 12 hour light/dark cycle. The day before the surgery the rats are fasted over night with water *ad libitum*.

Unilateral 6-hydroxydopamine (6-OHDA) lesion of the middle forebrain bundle is performed according to the method described in Ungerstedt et al, *Brian Research*,  
15 24 (1970), p. 485-493, and Ungerstedt, *Eur. J. Pharmacol.*, 5 (1968), p. 107-110, with minor changes. Briefly, the animals are anaesthetized with chloral hydrate (400 mg/kg, ip) and treated with desipramine (10 mpk, ip) 30 min prior to 6-OHDA injection in order to block the uptake of the toxin by the noradrenergic terminals. Then, the animals are placed in a stereotaxic frame. The skin over the skull is reflected and the  
20 stereotaxic coordinates (-2.2 posterior from bregma (AP), +1.5 lateral from bregma (ML), 7.8 ventral from dura (DV) are taken, according to the atlas of Pellegrino et al (Pellegrino L.J., Pellegrino A.S. and Cushman A.J., A Stereotaxic Atlas of the Rat Brain, 1979, New York: Plenum Press). A burr hole is then placed in the skull over the lesion site and a needle, attached to a Hamilton syringe, is lowered into the left  
25 MFB. Then 8 µg 6-OHDA-HCl is dissolved in 4 µl of saline with 0.05% ascorbic acid as antioxidant, and infused at the constant flow rate of 1 µl /1 min using an infusion pump. The needle is withdrawn after additional 5 min and the surgical wound is closed and the animals left to recover for 2 weeks.

Two weeks after the lesion the rats are administered with L-DOPA (50 mg/kg,  
30 ip) plus Benserazide (25 mg/kg, ip) and selected on the basis of the number of full contralateral turns quantified in the 2 h testing period by automated rotameters

- 26 -

(*priming test*). Any rat not showing at least 200 complete turns /2h is not included in the study.

Selected rats receive the test drug 3 days after the priming test (maximal dopamine receptor supersensitivity). The new A<sub>2A</sub> receptor antagonists are  
5 administered orally at dose levels ranging between 0.1 and 3 mg/kg at different time points (i.e., 1, 6, 12 h) before the injection of a subthreshold dose of L-DOPA (4 mpk, ip) plus benserazide (4 mpk, ip) and the evaluation of turning behavior.

Using the above test procedures, the following results were obtained for preferred and/or representative compounds of the invention.

10 Results of the binding assay on compounds of the invention showed A<sub>2A</sub> Ki values of 0.3 to 1000 nM, with preferred compounds showing Ki values between 0.3 and 50 nM.

Selectivity is determined by dividing Ki for A1 receptor by Ki for A2a receptor. Preferred compounds of the invention have a selectivity ranging from about 100 to  
15 about 2000.

Preferred compounds showed about a 50-75% decrease in descent latency when tested orally at 1-3 mg/kg for anti-cataleptic activity in rats.

For preparing pharmaceutical compositions from the compounds described by this invention, inert, pharmaceutically acceptable carriers can be either solid or liquid.  
20 Solid form preparations include powders, tablets, dispersible granules, capsules, cachets and suppositories. The powders and tablets may be comprised of from about 5 to about 70 percent active ingredient. Suitable solid carriers are known in the art, e.g. magnesium carbonate, magnesium stearate, talc, sugar, lactose. Tablets, powders, cachets and capsules can be used as solid dosage forms suitable for oral  
25 administration.

For preparing suppositories, a low melting wax such as a mixture of fatty acid glycerides or cocoa butter is first melted, and the active ingredient is dispersed homogeneously therein as by stirring. The molten homogeneous mixture is then poured into convenient sized molds, allowed to cool and thereby solidify.

30 Liquid form preparations include solutions, suspensions and emulsions. As an example may be mentioned water or water-propylene glycol solutions for parenteral injection.

Liquid form preparations may also include solutions for intranasal administration.

Aerosol preparations suitable for inhalation may include solutions and solids in powder form, which may be in combination with a pharmaceutically acceptable carrier, such as an inert compressed gas.

Also included are solid form preparations which are intended to be converted, shortly before use, to liquid form preparations for either oral or parenteral administration. Such liquid forms include solutions, suspensions and emulsions.

The compounds of the invention may also be deliverable transdermally. The transdermal compositions can take the form of creams, lotions, aerosols and/or emulsions and can be included in a transdermal patch of the matrix or reservoir type as are conventional in the art for this purpose.

Preferably the compound is administered orally.

Preferably, the pharmaceutical preparation is in unit dosage form. In such form, the preparation is subdivided into unit doses containing appropriate quantities of the active component, e.g., an effective amount to achieve the desired purpose.

The quantity of active compound of formula I in a unit dose of preparation may be varied or adjusted from about 0.1 mg to 1000 mg, more preferably from about 1 mg to 300 mg, according to the particular application.

The actual dosage employed may be varied depending upon the requirements of the patient and the severity of the condition being treated. Determination of the proper dosage for a particular situation is within the skill of the art. Generally, treatment is initiated with smaller dosages which are less than the optimum dose of the compound. Thereafter, the dosage is increased by small increments until the optimum effect under the circumstances is reached. For convenience, the total daily dosage may be divided and administered in portions during the day if desired.

The amount and frequency of administration of the compounds of the invention and the pharmaceutically acceptable salts thereof will be regulated according to the judgment of the attending clinician considering such factors as age, condition and size of the patient as well as severity of the symptoms being treated. A typical recommended dosage regimen for compounds of formula I is oral administration of from 10 mg to 2000 mg/day preferably 10 to 1000 mg/day, in two to four divided

- 28 -

doses to provide relief from central nervous system diseases such as Parkinson's disease. The compounds are non-toxic when administered within this dosage range.

The doses and dosage regimen of the dopaminergic agents will be determined by the attending clinician in view of the approved doses and dosage regimen in the package insert, taking into consideration the age, sex and condition of the patient and the severity of the disease. It is expected that when the combination of a compound of formula I and a dopaminergic agent is administered, lower doses of the components will be effective compared to the doses of the components administered as monotherapy.

The following are examples of pharmaceutical dosage forms which contain a compound of the invention. Those skilled in the art will recognize that dosage forms can be modified to contain both a compound of formula I and a dopaminergic agent. The scope of the invention in its pharmaceutical composition aspect is not to be limited by the examples provided.

#### Pharmaceutical Dosage Form Examples

##### EXAMPLE A-Tablets

No.	Ingredients	mg/tablet	mg/tablet
1.	Active compound	100	500
2.	Lactose USP	122	113
3.	Corn Starch, Food Grade, as a 10% paste in Purified Water	30	40
4.	Corn Starch, Food Grade	45	40
5.	Magnesium Stearate	<u>3</u>	<u>7</u>
Total		300	700

#### Method of Manufacture

Mix Item Nos. 1 and 2 in a suitable mixer for 10–15 minutes. Granulate the mixture with Item No. 3. Mill the damp granules through a coarse screen (e.g., 1/4", 0.63 cm) if necessary. Dry the damp granules. Screen the dried granules if necessary and mix with Item No. 4 and mix for 10–15 minutes. Add Item No. 5 and mix for 1–3 minutes. Compress the mixture to appropriate size and weigh on a suitable tablet machine.

- 29 -

EXAMPLE B-Capsules

No.	Ingredient	mg/capsule	mg/capsule
1.	Active compound	100	500
2.	Lactose USP	106	123
3.	Corn Starch, Food Grade	40	70
4.	Magnesium Stearate NF	<u>7</u>	<u>7</u>
Total		253	700

Method of Manufacture

Mix Item Nos. 1, 2 and 3 in a suitable blender for 10-15 minutes. Add Item No. 4 and mix for 1-3 minutes. Fill the mixture into suitable two-piece hard gelatin capsules on a suitable encapsulating machine.

While the present invention has been described in conjunction with the specific embodiments set forth above, many alternatives, modifications and variations thereof will be apparent to those of ordinary skill in the art. All such alternatives, modifications and variations are intended to fall within the spirit and scope of the present invention.

We claim:

1. A compound represented by the structural formula

- 5 or a pharmaceutically acceptable salt thereof, wherein

R is R<sup>1</sup>-heteroaryl, R<sup>10</sup>-phenyl, C<sub>4</sub>-C<sub>6</sub> cycloalkenyl, -C(=CH<sub>2</sub>)CH<sub>3</sub>, -C≡C-CH<sub>3</sub>,

X is C<sub>1</sub>-C<sub>6</sub> alkylene, -C(O)CH<sub>2</sub>- or -C(O)N(R<sup>2</sup>)CH<sub>2</sub>-;

Y is -N(R<sup>2</sup>)CH<sub>2</sub>CH<sub>2</sub>N(R<sup>3</sup>)-, -OCH<sub>2</sub>CH<sub>2</sub>N(R<sup>2</sup>)-, -O-, -S-, -CH<sub>2</sub>S-, -(CH<sub>2</sub>)<sub>2-3</sub>-N(R<sup>2</sup>)-,

- 10 R<sup>5</sup>-divalent heteroaryl,

and

Z is R<sup>5</sup>-phenyl, R<sup>5</sup>-phenyl(C<sub>1</sub>-C<sub>6</sub>)alkyl, R<sup>5</sup>-heteroaryl, R<sup>5</sup>-bicyclic heteroaryl, R<sup>5</sup>-benzofused heteroaryl, diphenylmethyl or R<sup>6</sup>-C(O)-;

- 15 or when Y is

Z is also R<sup>6</sup>-SO<sub>2</sub>-, R<sup>7</sup>-N(R<sup>8</sup>)-C(O)-, R<sup>7</sup>-N(R<sup>8</sup>)-C(S)- or R<sup>6</sup>OC(O)-;

or when Q is , Z is also phenylamino or pyridylamino;

or Z and Y together are

- 31 -

or Y and Z together form a piperidinyl or pyrrolidinyl ring fused to a monocyclic or bicyclic aryl or a monocyclic or bicyclic heteroaryl ring wherein X is attached to the N atom of the piperidinyl or pyrrolidinyl ring;

- 5  $R^1$  is 1 to 3 substituents independently selected from hydrogen,  $C_1$ - $C_6$ -alkyl,  $-CF_3$ , halogen,  $-NO_2$ ,  $-NR^{12}R^{13}$ ,  $C_1$ - $C_6$  alkoxy,  $C_1$ - $C_6$  alkylthio,  $C_1$ - $C_6$  alkylsulfinyl,  $C_1$ - $C_6$  alkylsulfonyl,  $-COOR^7$  or  $-C(O)NR^2R^3$ ;

$R^2$  and  $R^3$  are independently selected from the group consisting of hydrogen and  $C_1$ - $C_6$  alkyl;

- 10 m and n are independently 2-3;

p and q are independently 0-2;

Q and  $Q^1$  are independently selected from the group consisting of

Q is  $\text{---}\overset{|}{\text{N}}\text{---}$  or  $\text{---}\overset{|}{\text{CH}}\text{---}$ , m and n are each 2, R<sup>4</sup> is H, Z is R<sup>5</sup>-phenyl or R<sup>5</sup>-heteroaryl, and R<sup>5</sup> is H, halogen, C<sub>1</sub>-C<sub>6</sub> alkyl, C<sub>1</sub>-C<sub>6</sub> alkoxy, hydroxy(C<sub>1</sub>-C<sub>6</sub>)alkoxy or (C<sub>1</sub>-C<sub>6</sub>)alkoxy(C<sub>1</sub>-C<sub>6</sub>)alkoxy.

10

5. A compound of claim 1 selected from the group consisting of

15

- 34 -

6. A pharmaceutical composition comprising a therapeutically effective amount of a compound of claim 1 in a pharmaceutically acceptable carrier.

5 7. The use of a compound of claim 1 for the preparation of a medicament for treating a central nervous system disease or stroke.

8. A pharmaceutical composition comprising a therapeutically effective amount of a combination of a compound of claim 1 and 1 to 3 other agents useful in treating Parkinson's disease in a pharmaceutically acceptable carrier

10

9. The use of a combination of a compound of claim 1 and 1 to 3 other agents selected from the group consisting of L-DOPA, dopaminergic agonists, MAO-B inhibitors, DOPA decarboxylase inhibitors and COMT inhibitors for treating Parkinson's disease.
